## 1 Introduction

This file implements adaptations to the `amsmath` package needed for the tagging project.

---

\*

## 2 The Implementation

Better no @@ expansion here .....

```
1 <@@=>
2 <*kernel>
```

### 2.1 File declaration

```
3 \ProvidesFile{latex-lab-amsmath.ltx}
4 [2025-03-07 v0.1f amsmath adaptations]
```

### 2.2 Tagpdf support

To make the code independent from tagging being loaded and active we load the tagpdf-base package:

```
5 \RequirePackage{tagpdf-base}
6 \ExplSyntaxOn
```

### 2.3 Measuring

When measuring we neither want tagging nor the luamml processing.

```
\measuring@true
7 \def\measuring@true{\let\ifmeasuring@\iftrue\tag_suspend:n{\measuring}\luamml_ignore:}
(End of definition for \measuring@true. This function is documented on page ??.)
```

### 2.4 Display environments

#### 2.4.1 Tag

The tag/label must be saved, so that it can be reinserted later.

TODO: \maketag@@@ is perhaps used in places where tagging/luamml handling is not wanted. This must be checked and handled.

```
\maketag@@@
8 \def\maketag@@@#1
9 {%
10   \ifmeasuring@
11     \hbox{\m@th\normalfont#1}%
12   \else
13     \UseTaggingSocket{math/display/tag/begin}
14     \hbox{\m@th\normalfont#1
15     \UseTaggingSocket{math/luamml/mtable/tag/save}
16     }%
17     \UseTaggingSocket{math/display/tag/end}
18   \fi
19 }
```

*(End of definition for \maketag@@@. This function is documented on page ??.)*

\eqref uses \tagform@ and so \maketag@@@ but we do not want this tagging there.

```

\eqref
\maketag@@@notog
20 \def\maketag@@@notag#1{\hbox{\m@th\normalfont#1}}
21 \DeclareRobustCommand{\eqref}[1]
22   {\textup{\let\maketag@@@\maketag@@@notag\tagform@{\ref{#1}}}}

```

(End of definition for \eqref and \maketag@@@notog. These functions are documented on page ??.)

## 2.4.2 align & friends

Most display environment uses a common command for the end which contains the luamml socket to finalize the mtable.

```

\common@align@ending
23 \def\common@align@ending {
24   \math@cr \black@totwidth@
25   \UseExpandableTaggingSocket {math/luamml/mtable/finalize} {\@currenvir}
26   \egroup
27   \ifingather@
28     \restorealignstate@
29     \egroup
30     \nonumber
31     \ifnum0='{ \fi \iffalse } \fi
32   \else
33     \dollar@end
34   \fi
35   \ignorespacesafterend
36 }

```

(End of definition for \common@align@ending. This function is documented on page ??.)

Now we redefine the display alignments to use these ending.

```

37 \renewenvironment{align}{%
38   \start@align\@ne\st@rredfalse\m@ne
39 }{%
40   \common@align@ending
41 }
42 \renewenvironment{align*}{%
43   \start@align\@ne\st@rredtrue\m@ne
44 }{%
45   \common@align@ending
46 }
47 \renewenvironment{alignat}{%
48   \start@align\z@\st@rredfalse
49 }{%
50   \common@align@ending
51 }
52 \renewenvironment{alignat*}{%
53   \start@align\z@\st@rredtrue
54 }{%
55   \common@align@ending
56 }
57 \renewenvironment{flalign}{%
58   \start@align\tw@\st@rredfalse\m@ne
59 }{%
60   \common@align@ending

```

```

61 }
62 \renewenvironment{flalign*}{%
63   \start@align\tw@\st@rredtrue\m@ne
64 }{%
65   \common@align@ending
66 }
67 \renewenvironment{xalignat}{%
68   \start@align\@ne\st@rredfalse
69 }{%
70   \common@align@ending
71 }
72 \renewenvironment{xalignat*}{%
73   \start@align\@ne\st@rredtrue
74 }{%
75   \common@align@ending
76 }
77 \renewenvironment{xxalignat}{%
78   \start@align\tw@\st@rredtrue
79 }{%
80   \common@align@ending
81 }

```

And register these environments for the math grabbing.

```

82 \math_register_halign_env:nn {align}{}
83 \math_register_halign_env:nn {align*}{}
84 \math_register_halign_env:nn {alignat}{}
85 \math_register_halign_env:nn {alignat*}{}
86 \math_register_halign_env:nn {flalign}{}
87 \math_register_halign_env:nn {flalign*}{}
88 \math_register_halign_env:nn {xalignat}{}
89 \math_register_halign_env:nn {xalignat*}{}
90 \math_register_halign_env:nn {xxalignat}{}

```

The align preamble (used in \align@) needs code for luamml to save the cells.

\align@preamble

```

91 \def\align@preamble{%

### 2.4.3 gather and gather\*

178 }

```

(End of definition for `\gather@`. This function is documented on page ??.)

`\endgather`

```

179 \def\endgather{

184   \dollar@end
185   \ignorespacesafterend
186 }

```

(End of definition for `\endgather`. This function is documented on page ??.)

The original definition of `gather*` uses `\endgather` but this redirection doesn't work if we alter `gather` so we use the real meaning and add the socket.

`gather* (env.)`

```

187 \renewenvironment{gather*}
188 {
189   \start@gather\st@rredtrue
190 }
191 {
192   \math@cr

195   \egroup
196   \dollar@end
197   \ignorespacesafterend
198 }

```

Register both environments

```
199 \math_register_halign_env:nn {gather}{}
200 \math_register_halign_env:nn {gather*}{}

```

#### 2.4.4 gathered, aligned and alignedat

These environments are not grabbed as they are inside other display environments but they need various sockets for luamml support.

`\start@aligned`

This save the cell and then finalize it.

```

277 }

```

(End of definition for `\endaligned`. This function is documented on page ??.)

#### 2.4.5 `multline` and `multline*`

`multline*` needs a redefinition before it is registered as it uses `\endmultline`, this must be replaced by the true code.

`multline* (env.)`

```

278 \renewenvironment{multline*}{\start@multline\st@rredtrue}
279 {%
280     \iftagsleft@ \@xp\lendmultline@ \else \@xp\rendmultline@ \fi

```

```

281 \ignorespacesafterend
282 }

```

And now we register both

```

283 \math_register_halign_env:nn {multiline}{ }
284 \math_register_halign_env:nn {multiline*}{ }

```

In the internal commands we have to add sockets for alignment attributes

`\multiline@`

```

285 \def\multiline@#1{%

287   \@display@init{\global\advance\row@\@ne \global\dspbrk@lvl\m@ne}%

Luckily, `\multline` uses `\endmultline@math` in exactly the spot where we have to set the flag. Less luckily, `\endmultline@math` sometimes get overwritten for the last line. But that isn't much of a problem since we want special behavior there anyway.

## 2.6 The split environment

The split environment is not trivial to handle as it has a rather convoluted implementation in `amsmath`: depending on in which display environment it is embedded it takes different branches, which makes it difficult to finalize the mtable.

The following patches work with `leqno` and `reqno` if the (default) `centertags` are used. The currently fail (the structure is wrong) if the option `tbtags` is used. The

alignment of the cells is currently not handled. A simple debug command until everything is sorted.

```

\__math_split_debug_typeout:n
446 \cs_new:Npn\__math_split_debug_typeout:n#1{\use_none:n{#1}}
(End of definition for \__math_split_debug_typeout:n.)
    We need to detect if \gather@split has been used or not

\l__math_gathersplit_bool
447 \bool_new:N\l__math_gathersplit_bool
(End of definition for \l__math_gathersplit_bool.)
    At first a redefinition of the main environment. Here we only have to add the saving
    command for the inner table:

```

```

split (env.)
448 \renewenvironment{split}{%
449   \__math_split_debug_typeout:n {begin~split}
450   \if@display
451     \ifinner
452       \@xp\@xp\@xp\split@aligned
453     \else
454       \ifst@rred \else \global\@eqnswtrue \fi
455     \fi
456   \else
457     \let\endsplit\@empty \@xp\collect@body\@xp\split@err
458   \fi
459   \collect@body\gather@split
460 }{\__math_split_debug_typeout:n{end~split}}%
461   \crrc
462   \UseExpandableTaggingSocket{math/luamml/mtable/innertable/save}%
463   \egroup
464 \egroup
465 \iftagsleft@ \@xp\lendsplit@ \else \@xp\rendsplit@ \fi
466 }

```

In \gather@split we have to add the finalization socket. We also set the boolean to true so that we can detect if the finalization has already happened. Perhaps this could be done in the luamml code instead?

```

And now the difficult part. Depending on the options `leqno/reqno` `\lendsplit@` or `\rendsplit@` are used for the typesetting and the inner table must be finalized here in case this hasn't happen yet. This must be tested with the boolean from `\gather@split`

## 2.8 `\text`

The `\text` command uses `\mathchoice` which “typesets” the argument four times. This makes it quite problematic for tagging. Without precautions structure objects would be created four times and would get MC-chunks as kids that don’t really exist. `amsmath` contains a switch that allows to execute code only in the first (`displaymath`) branch, but that isn’t usable here. At first because we don’t know if the first branch creates the same structure as the one that is actually used. At second because the engines executes some commands like `\label` and `\pdfannot` only at shipout from the branch that really was used. So we would get structure data from one `\mathchoice`-branch and MC-labels and links from another one and that gets very messy.

We therefore have to avoid that tagging is active in unused branches. In `pdflatex` it is not possible to detect the `mathstyle` before, so we use a label. With `lualatex` is possible to redefine `\text` not to use `\mathchoice`
